# Schedule for Angular Training

Day#	Date	Topic
Day-1	16-Nov-2023	Custom Pipes in Angular
Day-2	17-Nov-2023	Parent-Child Communication
<b>Day-3</b>	<b>20-Nov-2023</b>	<b>Custom Directives in Angular</b>
Day-4	21-Nov-2023	Working with Reactive Forms
Day-5	22-Nov-2023	Dependency Injection and Services in Angular
Day-6	23-Nov-2023	Http Client – Server calls in Angular
Day-7	24-Nov-2023	Routing and Security in Angular
Day-8	27-Nov-2023	Unit Testing in Angular

Duration : 8 days ( 2hours per day) ; 2pm to 4 pm; 16<sup>th</sup> Nov – 27<sup>th</sup> Nov

Day3

# Custom Directives in Angular

# Index – Day3

---

- Introduction to Angular Directives
- Different types of Angular directives
- What is Custom Directives?
- How to Create Custom Directives?
  - Attribute Custom Directive
  - Structural Custom Directive

# Introduction to Angular Directives

# Introduction to Angular Directives

---

- Directives are classes that add additional behavior to elements in your Angular applications.
- Use Angular's built-in directives to manage forms, lists, styles, and what users see.
- Angular supports different types of directives to address corresponding requirements.
- Eg: `ngModel`, `ngClass`, `ngFor`, `ngIf`, etc...

# Different types of Angular directives

# Different types of Angular directives

---

Angular framework supports three different types of directives.

1. Component Directives
2. Attribute Directives
3. Structural Directives

# Different types of Angular directives

---

1. **Component** : This type of directive is the most common directive type in Angular.
2. **Attribute** : Change the appearance or behavior of an element.
3. **Structural** : Change the DOM layout by adding and removing DOM elements.

# Component Directives

---

- Components are directives with templates.
- The only difference between Components and the other two types of directives is the Template.
- Attribute and Structural Directives don't have Templates.
- So, we can say that the Component is a cleaner version of the Directive with a template, which is easier to use.

**Structural**

**Attribute Directives**

# Attribute and Structural

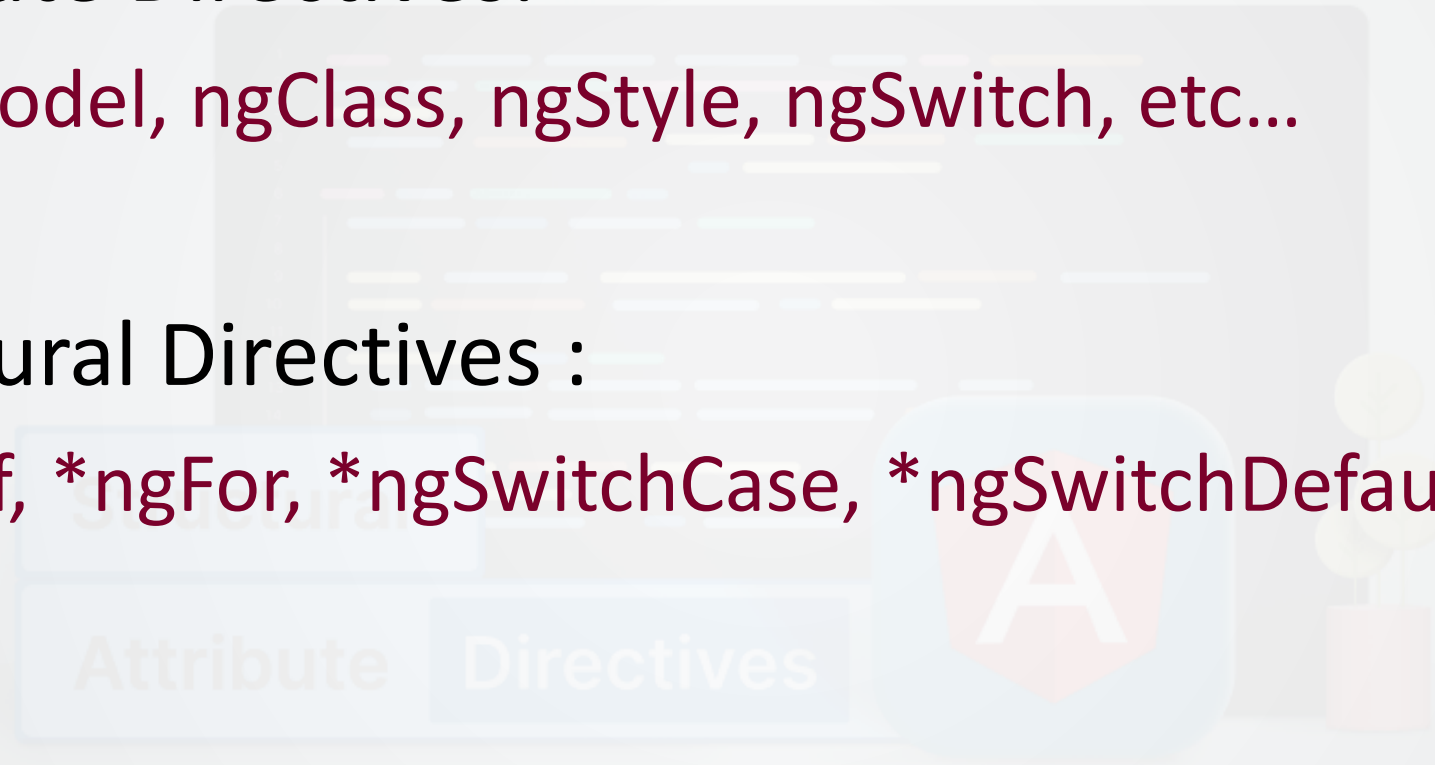

---

## 1. Attribute Directives:

- ngModel, ngClass, ngStyle, ngSwitch, etc...

## 2. Structural Directives :

- \*ngIf, \*ngFor, \*ngSwitchCase, \*ngSwitchDefault

# Usage of ngSwitch

---

```
<tag [ngSwitch]="variable">  
  <tag *ngSwitchCase="value"> </tag>  
  <tag *ngSwitchCase="value"> </tag>  
  .....  
  .....  
  <tag *ngSwitchDefault> </tag>  
</tag>
```

# **Practical HandsOns**

# What is Custom Directives?

# Custom Directives

---

- Custom Directives are used in Angular to extend the functionality of HTML.
- Custom directives also created as class with corresponding rules.
- `@Directive()` decorator is used to mark the Custom Directive class.
- Custom Directives may be attribute or structural based on the requirement.

# How to Create Custom Directives?

# How to Create Custom Directives?

---

1. ng **g**enerate **d**irective highlight ( ng g d highlight)
2. @Directive() from @angular/core
3. Inject required items in constructor. It will be depends on the directive type.  
→ **constructor**(**private** el: **ElementRef**)
4. Define the required behaviour in the class
5. Applying the directive on Html Element / Component.

# Developing Attribute Custom Directive

# Attribute Custom Directives

---

- Import **ElementRef** from @angular/core.
- ElementRef grants direct access to the host DOM element through its **nativeElement** property.
- Add ElementRef in the directive's **constructor()** to inject a reference to the host DOM element
- Add logic to your Directive class that change the behavior.

# Attribute Custom Directives

---

```
import { Directive, ElementRef } from '@angular/core';

@Directive({
  selector: '[appHighlight]'
})
export class HighlightDirective {

  constructor(private el: ElementRef) {
    this.el.nativeElement.style.backgroundColor = 'yellow';
  }

}
```

# Passing Values to Attribute Directives

---

1. import Input from @angular/core.
2. Add an appHighlight @Input() property.
3. Use property binding with the appHighlight directive selector:

`<p [appHighlight]="color">Highlight me!</p>`

Note: The [appHighlight] attribute binding performs two tasks:

- a. Applies the highlighting directive to the <p> element
- b Sets the directive's highlight color with a property binding

# **Practical HandsOns**

# Developing Structural Custom Directive

# Structural Custom Directive

---

- Import Input, TemplateRef, and ViewContainerRef
- Inject TemplateRef and ViewContainerRef in the directive constructor as private variables.
- Apply Input() decorator on the property
- Define the required functionality in the class
- Apply on the html element / component

# 1. TemplateRef

---

## 1. TemplateRef:

- Refers the current tag on which we apply custom directive.
- **TemplateRef** is injected into the constructor of the custom directive class.

```
constructor(private templateRef: TemplateRef<any>) {  
    }  
}
```

## 2. ViewContainerRef

---

- It represents a container where one or more views can be attached.
- It can contain embedded views (created by instantiating a TemplateRef).
- We can organize the TemplateRef with the createEmbeddedView() method.

# ViewContainerRef

---

```
constructor(private viewContainer: ViewContainerRef,  
             private templateRef: TemplateRef<any>) {  
  
}
```

```
this.viewContainer.createEmbeddedView(this.templateRef);
```

```
this.viewContainer.clear();
```

# **Practical HandsOns**

**Q & A**
